Introduction

New series of population estimates

The figures in this volume are the first population estimates to be based on the results of the 1981 Census. They were produced by adjusting the 1981 Census small area statistics counts of usual residents to be consistent with the definition of resident used in the population estimates and then updating this base population for the changes occurring between 6 April and 30 June. They are not directly comparable with the previous series of estimates which were produced by annually updating a base population obtained from the 1971 Census, and which used a slightly different definition of resident population.

The estimates are termed provisional because not all the detailed 1981 Census data required were available and so some approximations had to be made. The nature of these approximations is indicated in the section describing the population base used and the adjustments made to the census data. A revised set of mid-1981 estimates, using more detailed census results will be published early in 1984.

In addition to the new census base, the lack of comparability with the previous series is due to a change in the definition of home population. Residents who were outside Great Britain on census night are now included and overseas visitors are excluded. Previously the overseas visitors were included and the absent residents were excluded. This change is possible because the 1981 Census provides a count of residents who were recorded as being absent outside Great Britain on census night while the 1971 Census did not.

For England and Wales as a whole most of the difference between these mid-1981 figures and what would have been expected from the mid-1980 population estimates is due to the change in definition but sub-nationally the main reason for the difference is the new census base. There

are only three local authorities where the change in definition is considered to significantly affect the population estimate. These are the City of Westminster, where the definition change results in a *reduction* of just over 10,000, Kensington and Chelsea where the reduction is over 4,000 and Camden where the reduction is 2,000. These London boroughs are the areas where most of the visitors from outside Great Britain were enumerated in 1971. For England and Wales as a whole the change in definition has *increased* the population estimates by about 280,000, or 0.6 per cent. The effect of the definition change and the new census base on the population estimates for standard regions and for regional health authorities is shown in Table 4. The results of a preliminary investigation of accumulated errors in the series based on the 1971 Census have been published in *OPCS Occasional Paper 29*.

Adjustments to 1981 Census data

The provisional estimate of the population resident in England and Wales on 30 June 1981 is 49.59 millions. This is over 1 million more than the number of usual residents recorded in the small area statistics that were taken as the starting point. Table A quantifies the various adjustments made. The small area statistics are counts of people recorded on the census form for each address in an area as usually living there, whether or not they were present on census night. If there was no one present at an address on census night, anyone usually resident there was omitted. Also the counts for institutions included only the residents who were present - those who were elsewhere on census night were excluded. For England and Wales as a whole it is estimated that about 800,000 people were omitted from these counts of absent or present residents. This adjustment was therefore added. For the sub-national population estimates the total was shared out between the areas in proportion to the number of absent households in the area.

Table A Census to mid-year changes

thousands

April 1981 SAS usual residents	Adjustment to base			Components of change (3 months)				Mid-1981 home population
	Absent residents	Under- enumer- ation	Adjusting 0-4 years olds	Births	Deaths	Natural change	Net migration	
48,521.6	800.8	214.0	46.1	150.9	129.3	+21.6	-11.2	49,592.9

The population counts were also increased to take account of net under-enumeration in the census. The figure used for England and Wales, 214,000, was published in *OPCS Monitor CEN 82/3*. The sub-national corrections were obtained by sharing out the England and Wales total taking into account the number of absent and vacant households in each area, the type of area and the size of the population.

The Monitor also explained that for various reasons this estimate of under-enumeration is subject to some error and that work is in progress to compare the census counts for various sub-groups of the population with data from other sources. Although these checks have not been completed, in these provisional population estimates the number of England and Wales residents who are children under 5 years of age was estimated by adjusting the numbers of registered births in the five years before census day for subsequent deaths and migration rather than by using the 1981 Census count of such children. Sub-nationally the estimated numbers of children aged under 5 years were produced by sharing out the England and Wales total, derived from birth registrations, proportional to the census counts of residents in this age-group for each area.

The census definition of the usually resident population of an area reflects the overall census constraints and priorities which may conflict with the purposes for which the annual population estimates are prepared. Thus the local authorities and central government have agreed that the population estimates and

the census should use different definitions of area of residence for students, prisoners and members of the armed forces. So, for the purposes of sub-national population estimates, adjustments need to be made to the counts of usual residents from the 1981 Census. The adjustments, which do not affect the total for England and Wales, are:

a) *Students*

In the population estimates students are regarded as resident at their term-time address while the 1981 Census instructions stated that they should be regarded as usually living at their home address. The adjustment is thus to add to the population of each area the estimated number of students who live there during term-time and to subtract the estimated number whose homes are there. This was done separately for each age and sex category.

The estimated number of students living in each local government area during term-time was reported by local authorities and the figures supplied were adjusted to be consistent with central government data on the number of students attending a university or a boarding school in each area. The census counts of students having a home address in each area were scaled down so that the total for England and Wales was the same as the number of term-time residents obtained from local and central government.

b) *Armed forces*

For the purposes of population estimates, members of the armed forces are included in the population of the area in which

they are stationed. Data on the number of armed forces stationed in each area on 30 June are obtained annually from the Ministry of Defence. The adjustment needed is thus to add this figure and to subtract the armed forces who were recorded in the census as being usually resident there. Because 1981 Census data on members of the armed forces were not available in time, the figures were estimated by adjusting the equivalent 1971 Census data so that they summed to the mid-1981 number of armed forces stationed in England and Wales.

c) *Inmates of prisons*

In the census, a prisoner was regarded as usually resident in a prison if he had been present for at least 6 months at the time of the census. The population estimates definition however refers to an expected stay of 6 months or more. Although the difference is small the census counts of resident prisoners in each area were replaced with counts recorded by the Home Office on 30 June 1981. The discrepancy at the England and Wales level was then eliminated by sharing out the difference between all areas in proportion to the age and sex distribution of all prisoners.

Future population estimates

The provisional mid-1982 population estimates will be produced from transfer population counts. These are counts which use the information on the usual address of people recorded as visitors. The small area statistics counts of residents who were absent elsewhere in Great Britain on census night are replaced by counts of people who were recorded elsewhere in Great Britain as visitors and who usually live in the specified area. In effect people recorded as visitors are transferred from the area where they were enumerated back to the area where they usually live. The number of unrecorded absent residents who were outside Great Britain will be estimated and included in the same way as for the provisional estimates.

Detailed data on migrants and armed forces are required in order to produce revised mid-1981 estimates. These data should be available towards the end of

1983 and the estimates will be produced shortly after.

Related publications

The OPCS quarterly journal *Population Trends* always contains commentary and tables of population estimates. Four recent issues which contained articles concerned with population were:

- Number 26 : Population trends in rural Britain
- Number 27 : Recent population growth and the effect of the decline in births
- Number 28 : Census small area statistics (SAS): measuring change and spatial variation
- Number 29 : Evolution of population estimates in England and Wales
The new district health authorities

The 1981 Census *County reports* and *Monitors* present population and other tables derived from the small area statistics. The *1981 Census Usual residents* volume contains transfer population data. These published populations are not directly comparable with population estimates as they do not take account of the adjustments described earlier.

Articles too lengthy for *Population Trends* are often published in the form of an *OPCS Occasional Paper*. The following discuss matters related to population estimates:

- Number 18 : Local authority population estimates methodology
- Number 20 : Extending the electoral register - 1
- Number 22 : The revised mid-1971 population estimates for local authorities compared with the original estimates
- Number 29 : A comparison of the Registrar General's population estimates for England and Wales with the results of the 1981 Census

Local authority vital statistics (series VS) presents data on births and deaths for the residents in each local authority and health area.

OPCS Monitors, series PP1 provide up-to-date summaries of the most recent population estimates. All *OPCS Monitors* can be obtained by writing to:

Information Branch (Dept M)

For more information about the series of population estimates and the possibility of obtaining unpublished data please write to the Population Estimates Unit at the address given above.

Standard regions

The standard regions of England, used for statistical purposes, are defined as:

North	South East - continued
Cleveland	Greater London
Cumbria	Hampshire
Durham	Hertfordshire
Northumberland	Isle of Wight
Tyne and Wear	Kent
	Oxfordshire
Yorkshire and Humberside	Surrey
Humberside	West Sussex
North Yorkshire	South West
South Yorkshire	Avon
West Yorkshire	Cornwall and Isles of Scilly
East Midlands	Devon
Derbyshire	Dorset
Leicestershire	Gloucestershire
Lincolnshire	Somerset
Northamptonshire	Wiltshire
Nottinghamshire	
East Anglia	West Midlands
Cambridgeshire	Hereford and Worcester
Norfolk	Shropshire
Suffolk	Staffordshire
	Warwickshire
	West Midlands
South East	North West
Bedfordshire	Cheshire
Berkshire	Greater Manchester
Buckinghamshire	Lancashire
East Sussex	Merseyside
Essex	

Commentary

The use of a new census base and a new home population definition means that care must be taken when comparing the mid-1981 estimates with those for earlier years. However Table 4 shows that for England and Wales as a whole there was a small real increase in the population during the 12 months to mid-1981 because the surplus of births over deaths was slightly greater than the surplus of emigrants over immigrants. The net balance of migration for the period was considerably different to that for the previous 12-month period - a net outflow of 50,000 compared with a net inflow of 2,000. Table 4 shows that differences in the population change of sub-national areas are due more to differences in net migration than in natural change. On the whole the more urban regions lost population through migration while the more rural ones

gained. The South West was the only region having more deaths than births.

The populations in the four broad age-groups which relate to different stages of life are shown in Table B. The number of school age children decreased by over 240,000, a drop of 3 per cent in the 12-month period. The recent increases in the birth rate caused the number of pre-school age children to increase by nearly 48,000. People of working age now constitute 60 per cent of the population. Table B also shows the population in the four marital conditions. The number of single and widowed people increased slightly; the number of married people decreased and, not surprisingly this decrease was almost matched by the increase in the number who are divorced. This latter figure rose by nearly 10 per cent.

Table B Home population by age and marital condition

England and Wales

Divorced	1,389.8	2.8	+124.6	+9.8

* Natural change and migration only - does not include changes in definition.

Table C shows the local government areas having the largest population growth or decline in the 12 months to mid-1981 and the areas with the largest or smallest percentage of the population who are pre-school age children, school age children or pensioners. Milton Keynes was the most rapidly growing district. This is almost entirely comprised of a new town. Not surprisingly Milton Keynes

was also one of the districts for which young children were a larger than average percentage of the population and pensioners a smaller than average percentage. On the other hand the London boroughs of the City of Westminster, and Kensington and Chelsea were rapidly declining and also had relatively few young children.

Table C Districts with largest and smallest population growth and percentages of population in selected groups at mid-1981
